Magma Devs

Lava Smart Router Enterprise Readiness

CTO Assignment | Guy Harry

AGENDA

01 Deliverables

02 Reasoning: Why Retry, Health, Observability?

03 Biggest Hidden Reliability Risk

04 Long-Term Moat

05 Most Likely Catastrophic Incident

06 Next Steps (90-Day Plan)

Deliverables

All in repo: cto-assignment/

01	Technical & Enterprise Assessment	architecture, risks, failure modes, 90-day hardening, non-goals (6–8 pp)
02	Architecture & Retry Hardening	stack, retry/failover behavior, recommended hardening
03	Dashboard	How it works / Why enterprises care / Commercial metrics / Risks (simulated data)
04	This presentation	

Reasoning: Why Retry, Health, Observability?

Thesis: For custodians/exchanges, value = reliability. Gaps = hardening under failure.

Retry/ban

Stateless retries up to 10× then bans request hash 6h → reduce storms but allow shorter/scoped ban.

Health + circuit breaker

5m health default; no per-provider circuit breaker → add breaker + configurable interval.

Observability

Document Prometheus + SLO-style metrics and alerting.

Not focusing on: New chains, new APIs, Kafka/analytics first.

Biggest Hidden Reliability Risk

No retries for Stateful/CrossValidation + no per-provider circuit breaker

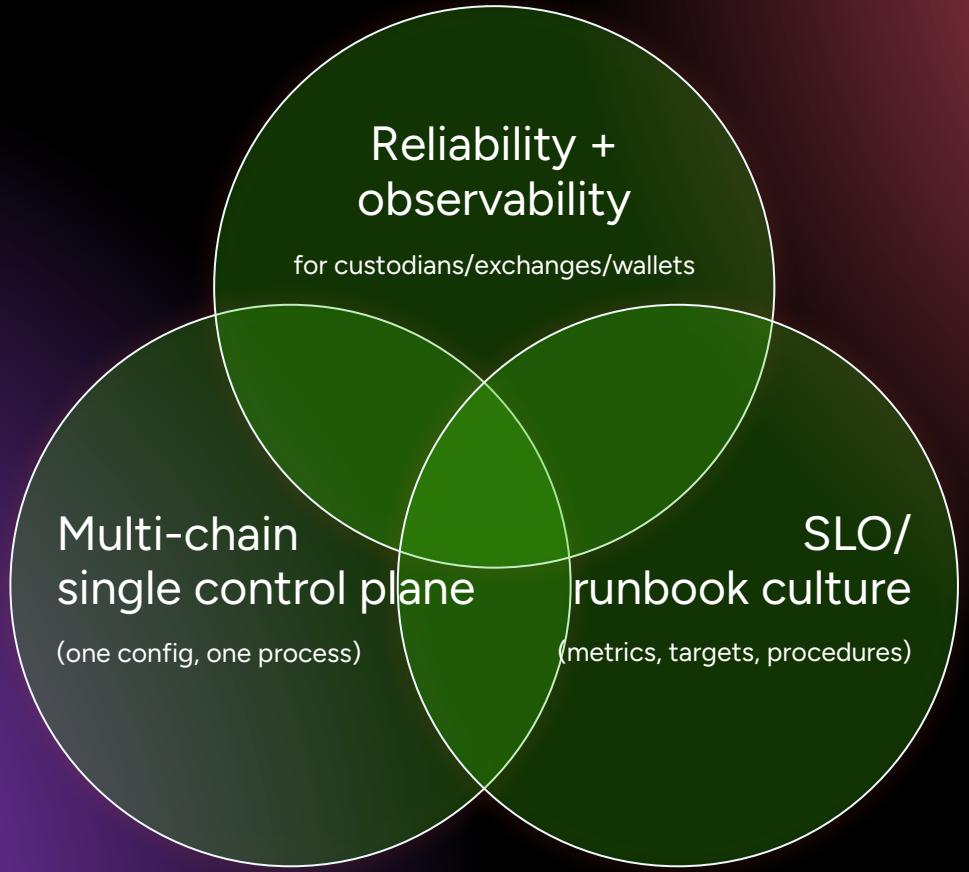
Today

- no retry for Stateful/CrossVal
- no circuit breaker

Needed

- retry or fast fail
- circuit breaker

Long-Term Moat



Most Likely Catastrophic Incident

Next Steps (90-Day Plan)

Phase 1 (1–30)

Observability + circuit breaker + health interval

Phase 2 (31–60)

Retry/ban policy (TTL, scope, batch opt-in)

Phase 3 (61–90)

Rate limiting, runbooks, chaos/integration tests

Explicit non-goals:

- Rebuild in another language
- new protocols/chains first
- ML/pricing
- Kafka before Prometheus solid

THANK YOU

Any questions?
